Typical excavated Grubenhäuser
from 3 UK sites (Glover, 1985)

- ❖ Small sized
- ❖ Excavated floors lined with planks or packed clay
- ❖ Multiple use – workshops rather than dwellings
 - Pottery
 - Weaving
 - Metal-working
 - Animal husbandry...etc.
- ❖ Usually found in association with timber-framed halls

- ❖ **Electrical survey**
- ❖ **ABEM Mk II Terrameter**
- ❖ **In-house designed meter**
- ❖ **33 electrodes multiplexed into 4**
- ❖ **Survey area approximately 110 m x 110 m (10140 m²)**
- ❖ **Surveyed during May and June, under short winter wheat**
- ❖ **Light, sandy topsoil after dry weather**

- ❖ Each structure has an electrical signature or source function
- ❖ Predictive deconvolution – need to predict the source function
- ❖ Source function can be calculated uniquely from a geometrical model of the subsurface feature
- ❖ The model, however, is not unique
- ❖ The method restores the target structure...
...but destroys structures of other geometries
- ❖ Analysis carried out by matrix inversion

❖ Five displays of data are shown:

- Un-deconvolved (raw) – best for fine detail such as small ditches and postholes (if at all)
- Deconvolved with 3 different widths
 - 3 m
 - 4 m
 - 5 m
- Combined data display

Results - Undeconvolved

- ❖ **Complex electrical survey data can be deconvolved to provide the location and extent of buried features **IF** their source signature can be predicted**
- ❖ **Electrical survey at New Bewick predicts the presence of at least 6 grubenhäuser**
- ❖ **One of the predicted grubenhäuser has been excavated and confirmed with the same dimensions as the survey predicted**
- ❖ **The site shows other features, and may be the site of a significant settlement (timber-framed halls?)**
