46

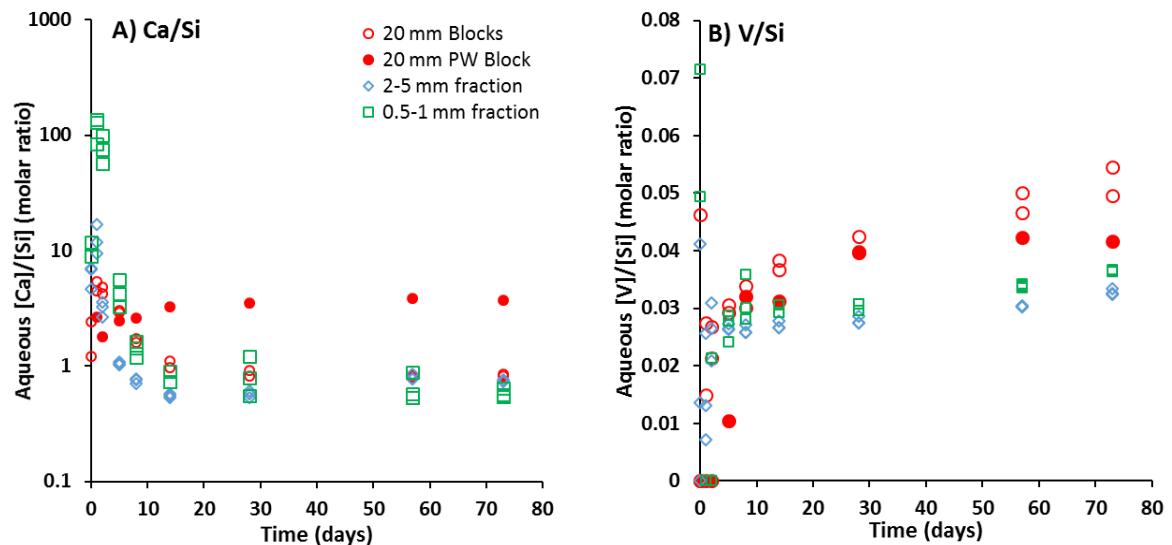

47

48 **SI Figure S1.** Example BSEI electron micrograph showing the primary ( $\text{Ca}_2\text{S}$  – larnite; B –  
49 Brownmillerite; L – Lime; W – Wusite; V – void space) and secondary Ca-Si-H and  $\text{CaCO}_3$  phases  
50 present at the surface of the aerobically weathered 20 mm BOF slag blocks after 6 months total  
51 immersion. All phases were identified by EDS spot analysis of representative regions. Alteration  
52 depths were defined as the changed surface region within the original volume of the slag particle  
53 (presence of refractory phases allows good estimation of the original particle size); the thickness of  
54 any  $\text{CaCO}_3$  layer was not included in the analysis.

55

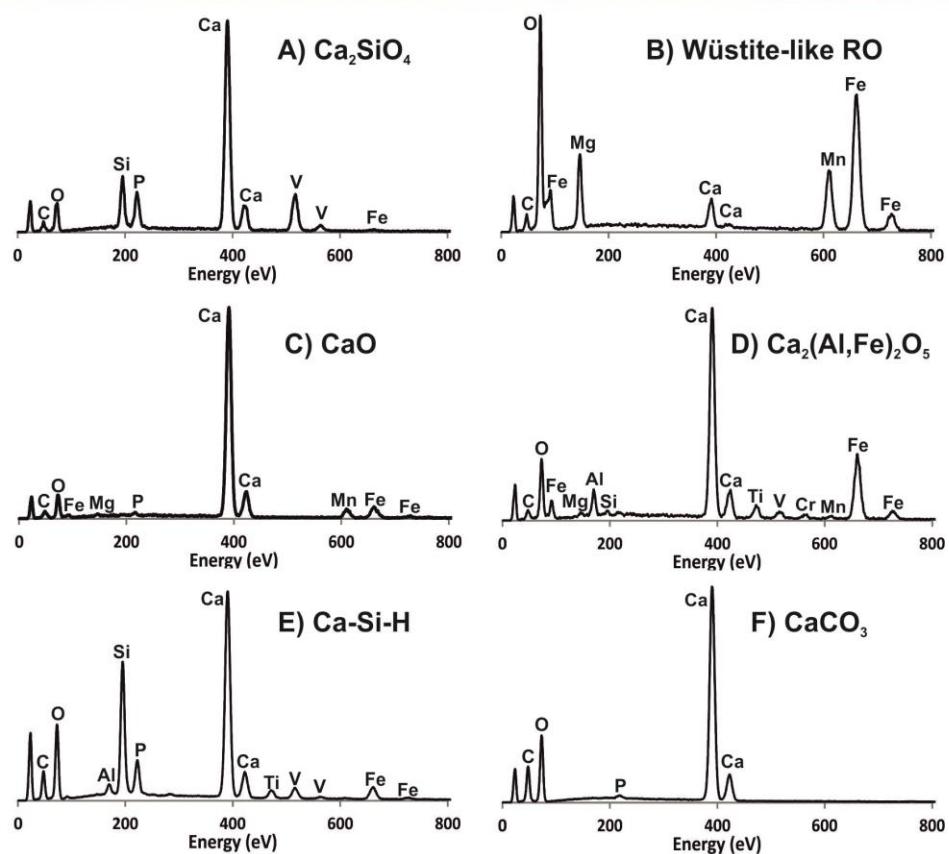

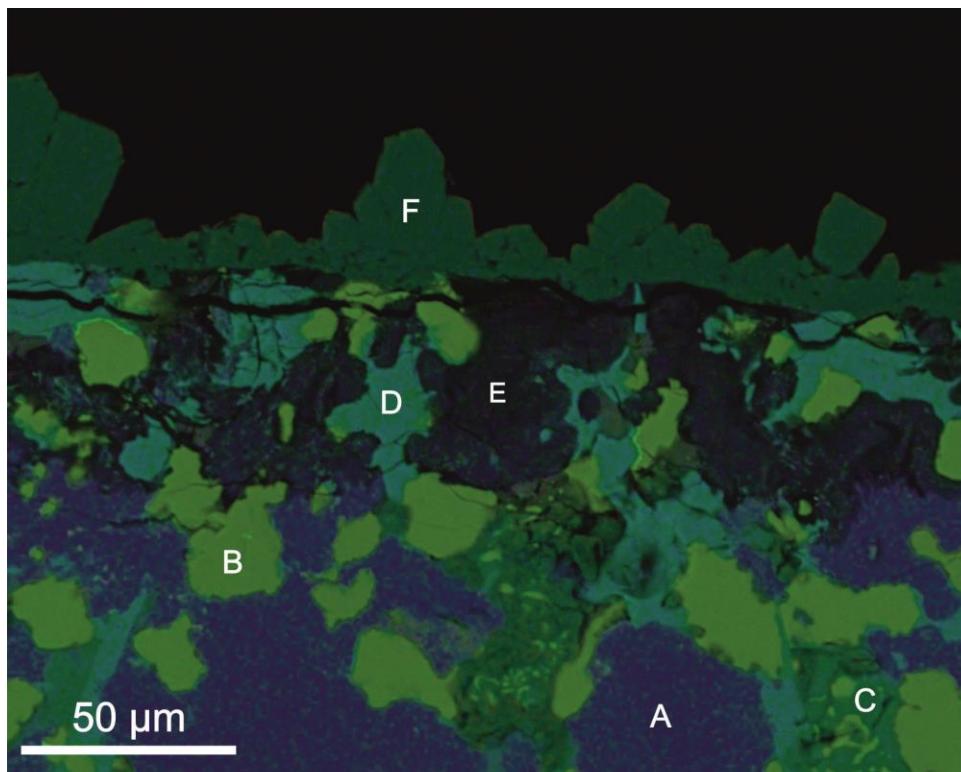

56  
57 SI Figure S2. XRD pattern collected from the crushed steel slag sample annotated with major phase  
58 peaks detected.  
59

60 **SI Figure S3.** Elemental cross-plots showing; A) The relationships between aqueous [Ca] and [Si],  
61 and; B) Aqueous [Si] and [V] in individual replicates during the leaching tests.

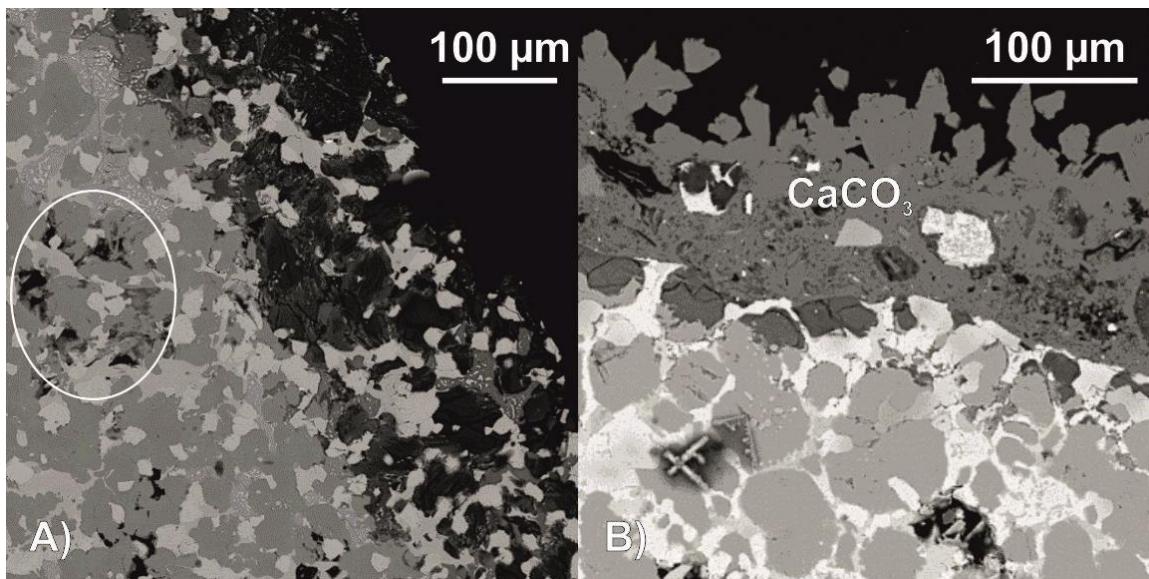

62

63

64 **SI Figure S4.** Composite false colour SEM-EDS elemental map showing phase discrimination within  
65 the 6 month pre-weathered BOF slag block. A-D) Example EDS spectra collected from each of the 6  
66 major phases detected with the slag; and E-F) Example EDS spectra from neo-formed phases present  
67 in the altered surface layer.

68

69 **SI Figure S5.** BSE images of different sized BOF slag particles after leaching for 73 days; (a) Block  
70 showing possible Ca-Si-H formation within occasional voids remote from the block surface, and (b)  
71 Sand-sized fraction showing CaCO<sub>3</sub> crystals on the weathered surface.
